

LEARNING JOURNEY

Biology

Topic 14 Organisms and the Environment

Organisms and
their
environment

Classification

In this lesson you will learn how organisms have been grouped together based on similar characteristics

Evolutionary trees

In this lesson you will use evolutionary trees to determine how closely related organisms are

Communities

In this lesson you will learn how groups of organisms are interdependent on one another

Organisms and their environment

In this lesson you will learn how different factors can be classed as abiotic and biotic

Distribution and abundance

In this lesson you will learn how to estimate population sizes using different techniques

Animal competition

In this lesson you will learn what resources animals compete for

Plant competition

In this lesson you will learn what resources plants compete for

Feeding relationships

In this lesson you will learn how population sizes of predators and prey are linked

Adapt and survive

In this lesson you will learn how different organisms have adapted to new environments

Adaptations in animals

In this lesson you will learn about specific animal adaptations to survive in extreme climates

Adaptations in plants

In this lesson you will learn about how plants have adapted to live in areas with poor nutrition

VOCABULARY

Competition
Adaptation
Interdependence
Species
Population

Classification
Factor
Abundance
Resources

This module continues your learning journey from previous learning in Key Stage 3 about the environment. You will develop a much greater understanding of interdependence between consumers and producers and how biomass is transferred through a food chain. You will also study how plants and animals have developed adaptations to help them compete in difficult environments and how best to measure the population size to determine their success.
